### **DETAILED ACTION**

Page 2

1: Claims 1-15 are presented for examination; claims 1, 11, and 12 independent.

## Double Patenting

2. The nonstatutory double patenting rejection is based on a judicially created doctrine grounded in public policy (a policy reflected in the statute) so as to prevent the unjustified or improper timewise extension of the "right to exclude" granted by a patent and to prevent possible harassment by multiple assignees. See *In re Goodman*, 11 F.3d 1046, 29 USPQ2d 2010 (Fed. Cir. 1993); *In re Longi*, 759 F.2d 887, 225 USPQ 645 (Fed. Cir. 1985); *In re Van Ornum*, 686 F.2d 937, 214 USPQ 761 (CCPA 1982); *In re Vogel*, 422 F.2d 438, 164 USPQ 619 (CCPA 1970); and, *In re Thorington*, 418 F.2d 528, 163 USPQ 644 (CCPA 1969).

A timely filed terminal disclaimer in compliance with 37 CFR 1.321(c) may be used to overcome an actual or provisional rejection based on a nonstatutory double patenting ground provided the conflicting application or patent is shown to be commonly owned with this application. See 37 CFR 1.130(b).

Effective January 1, 1994, a registered attorney or agent of record may sign a terminal disclaimer. A terminal disclaimer signed by the assignee must fully comply with 37 CFR 3.73(b).

- 1. Claims 1-18 of application no. 10/046,519 contain every element of claims 1-15 of the instant application and as such anticipate claims 1-15 of the instant application.
- 2. Claims 1-17 of application no. 10/046,516 contain every element of claims 1-15 of the instant application and as such anticipate claims 1-15 of the instant application.
- 3. Claims 1-31 of application no. 10/164,554 contain every element of claims 1-15 of the instant application and as such anticipate claims 1-15 of the instant application.

"A later patent claim is not patentably distinct from an earlier patent claim if the later claim is obvious over, or **anticipated by**, the earlier claim. <u>In re Longi</u>, 759 F.2d at 896, 225 USPQ at 651 (affirming a holding of obviousness-type double patenting because

Application/Control Number: 10/044,882 Page 3

Art Unit: 2143

the claims at issue were obvious over claims in four prior art patents); In re Berg, 140 F.3d at 1437, 46 USPQ2d at 1233 (Fed. Cir. 1998) (affirming a holding of obviousness-type double patenting where a patent application claim to a genus is anticipated by a patent claim to a species within that genus)." ELI LILLY AND COMPANY v BARR LABORATORIES, INC., United States Court of Appeals for the Federal Court, ON PETITION FOR REHEARING EN BANC (DECIDED: May 30, 2001).

## Claim Rejections - 35 USC § 103

- 3. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
  - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 4. This application currently names joint inventors. In considering patentability of the claims under 35 U.S.C. 103(a), the examiner presumes that the subject matter of the various claims was commonly owned at the time any inventions covered therein were made absent any evidence to the contrary. Applicant is advised of the obligation under 37 CFR 1.56 to point out the inventor and invention dates of each claim that was not commonly owned at the time a later invention was made in order for the examiner to consider the applicability of 35 U.S.C. 103(c) and potential 35 U.S.C. 102(e), (f) or (g) prior art under 35 U.S.C. 103(a).

Application/Control Number: 10/044,882

Art Unit: 2143

Claims 1 and 7-12 are rejected under 35 U.S.C. 103(a) as being unpatentable over Pace et al. (US 2003/0051236) (hereinafter Pace).

5. Referring to claim 1, Pace discloses a computer-implemented method for optimizing allocation of computer resources, comprising

establishing a plurality of server models (i.e. target node classes), each server model including one or more server nodes (i.e. those which reflect geographic, logical, business category-based and or any other general class relationships), wherein each server node has an associated a set of capacity attributes (an inherent feature since every server has attributes regarding its capacity, and therefore every class of target nodes has an associated set of capacity attributes) (p. 19, ¶ 306);

designating a layered relationship between the server models wherein for a first server-model layer immediately above a second server-model layer, the second server model layer includes respective models that represent the nodes in the first server-model layer (an inherent feature of a hierarchical relationship is that they contain subclasses) (p. 19, ¶ 306);

establishing a plurality of service models (i.e. system parts classes), each service model including one or more service nodes (i.e. reflect technical requirement, business purpose or any other general class relationships), wherein each service node has an associated a set of demand attributes (an inherent feature since metrics are returned p. 53 ¶ 808, which inherently requires that demands regarding the application must be there) (p. 19, ¶ 307);

Application/Control Number: 10/044,882

Art Unit: 2143

designating a layered relationship between the service models wherein for a first service-model layer immediately above a second service-model layer, the second service-model layer includes respective models that represent the nodes in the first service-model layer (an inherent feature of a hierarchical relationship is that they contain subclasses) (p. 19, ¶ 307);

generating an optimized mapping of service nodes in a user-selected service model to server nodes in a user-selected server model as a function of the demand and capacity attributes (the models are inherently user selected since the models must be created somehow based on characteristics stated in Pace, and therefore a network administrator would have to define those classes in some fashion) (p. 53, ¶ 808-811).

Pace does not disclose normalizing the capacity attributes of server nodes and demand attributes of service nodes. However it is well known that normalization of values is a simple statistical process that is done in order to obtain a base reference to interpret values resulting from heterogeneous entities. Therefore it would have been obvious to one of ordinary skill in the art to modify the teaching of Pace in order to include normalization of values in order to interpret values from different server and service nodes, and interpret these values in order to generate an optimized values taken with respect to their relationship with one another, thereby providing a more effective model of the service and server nodes and classes of nodes since Pace discloses that there are heterogeneous entities in the network (Figure 1G) which all contain different processing powers, it would be beneficial to one of ordinary skill in the

art to correlate these values in order to get a baseline reference on which to interpret these attributes and metrics.

Page 6

6. Claims 7-12 are rejected for similar reasons as stated above. Furthermore Pace inherently discloses establishing one or more service-node relationships between selected pairs of the service nodes, and establishing one or more server-node relationships between selected pairs of the server nodes, since any hierarchical relationship would have a reference to its parent and child level, and a transport demand can be considered a service demand since it is needed for the software.

Claims 2-6 and 13-15 are rejected under 35 U.S.C. 103(a) as being unpatentable over Pace in view of Hauser et al. (USPN 5,889,956) (hereinafter Hauser).

Referring to claims 2 and 3, Pace discloses the invention substantively as 7. described in claim 1. Pace furthermore inherently discloses establishing one or more service-node relationships between selected pairs of the service nodes, and establishing one or more server-node relationships between selected pairs of the server nodes, since any hierarchical relationship would have a reference to its parent and child level. Pace does not specifically disclose that the service-node relationships are processing and storage demand attributes, the server-node relationships are storage and demand capacity attributes, and generating an optimized mapping as a function of the service-node relationships and server-node relationships. In analogous art, Hauser

Art Unit: 2143

discloses a hierarchical resource management system which discloses a service node model relationships (i.e. between the users of the programming department 22 and the engineering department 16) are storage and processing demand attributes (i.e. a user of the lower level 22 requests resources of the system, which can be considered a demand attribute) (e.g. abstract; Figures 1-6). Hauser further discloses the hierarchical resource management system can also have processing and storage capacity attributes for the server nodes (i.e. the computers encompassed by the programming department 22 and the engineering department 16 since each level has an associated "Maximum Allowed" value which determines the capacity of the resource for the department) (e.g. abstract). Hauser furthermore discloses generating an optimized mapping as a function of the service node relationships and server node relationships (if a user has not met his "minimum\_guaranteed" value of resource, the system is optimized and extra capacity is taken from another department, 18 for example, and applied to the user, thereby providing an optimization between the service relationships and the server relationships). It would have been obvious to one of ordinary skill in the art to combine the teaching of Hauser with Pace since Pace discloses that load balancing models are well known in the art, this would motivate one of ordinary skill in the art for other methods of hierarchical resource management, eventually finding Hauser and its use of Maximum allowed values, and minimum guaranteed values (e.g. abstract).

Application/Control Number: 10/044,882 Page 8

Art Unit: 2143

8. Referring to claim 4, Pace in view of Hauser disclose the invention as described in claim 3. Pace-Hauser do not specifically disclose selecting a base server node and normalizing the attributes based upon that server, however this is a well known procedure in order to correlate differing information from heterogeneous resources into a format wherein the data can be examined against one another (i.e. a capacity index based upon a slower drive such that the faster ones will always be selected more often). BY this rationale it would have been obvious to normalize a server and service nodes as a base node to normalize attributes since this would be an efficient method to correlate all the attributes together and reduce overhead processing.

9. Referring to claims 5 and 6, Pace discloses generating an optimized mapping of service nodes in a user-selected service model to server nodes in a user-selected server model as a function of the demand and capacity attributes (the models are inherently user selected since the models must be created somehow based on characteristics stated in Pace, and therefore a network administrator would have to define those classes in some fashion) (p. 53, ¶ 808-811).

#### Conclusion

10. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.
